

director Support Services for the school system, and Pete Kelly, supervisor. A witness, whom he would not name, said he was at the meeting, which was held in the county's International 51,000 foot perimeter by the Workforce Development Board for Mathematics Technical Institute in Jacksonville, FLI. The witness said he was there to observe the meeting, which was to discuss the county's proposed artificial reef project. The witness said he was not invited to speak at the meeting.

Fate of Reefballs in DEP's hands

State inspectors voice concerns; tourism advocates embrace project

By Jim Hensler
Staff writer

County tourism officials should know today whether the state will give a thumbs up or down to the county's proposed Reefball site in the gulf between Crystal River and Homosassa.

State environmental officials came to the site with tourism board officials Monday for a third time to look at the bottom where the artificial reef posts will be placed — if the state grants a permit.

Reef-ball committee member Sam Lyons, as well as other Citrus officials who were present, were anxious Monday and expressed frustration that they haven't been able to get the Department of Environmental Protection to go along with the county's proposal.

They have already modified the project design and made various concessions to please the DED like putting the Reefballs in groups on flats to keep them from moving in storms. The county also has agreed to allow the DEP to oversee placement of the site.

DEP officials said they could get back to the county today with their assessment of the site.

Marcia Toledo, an environmental supervisor on the site Monday, said the problem is that there are "resources," or plant life, on the bottom at the site, in addition to the fact that the water is only 5 to 6 feet at low tide and the rule for artificial reefs is no less than 6 at any time.

Those conditions wouldn't normally

allow the state permits for artificial reef, she said, but she also noted that what the county is doing isn't actually artificial reef, it's designed to enhance reef populations as it has done nothing adverse with other materials.

The tourism board wants to provide a shallow reef about 3 miles offshore,

above the existing known reefs, where spawning grounds are thought to be.

Lyons said the county is providing

the funding for the project, which would

cost \$200,000 to \$400,000, according to Citrus officials.

"In the end, the county is going to get

what it wants," Lyons said. "Tourism officials are baffled at the cost of the project.

He said the county is looking forward to the opportunity for the DEP to issue a permit for artificial reef.

He said the DEP has agreed to place the

reef balls in the gulf to create such a

habitat for sea life," Lyons said.

The Reefballs quickly show sea life and are expected to last hundreds of years, looking and acting like real coral

structures of concrete of varying sizes, connected with holes to the interior. They measure about 3 feet in diameter and are adjusted to accommodate

the project would place 20 to 25 groups of Reefballs — 3 feet in diameter each — in four to six drift flats or the bottom, in a sort of underwater nature center or park, for tourists and students to observe.

The Reefballs quickly show sea life and are expected to last hundreds of years, looking and acting like real coral foundations. In just a few years, the

douglasia, a burrowing invertebrate, and

takes up residence.

The tourism board's idea is to buy the artificial reef posts from a Sarasota company now and take advantage of a large coming back from that location to get the best price here and purchased on the best terms.

If the state doesn't tell the county it wants to issue a permit soon, though, the opportunity will be lost. Barge costs and logistics are some of the largest contributions to such a project, county officials say.

Taking advantage of that unanticipated window of opportunity could save the county money from \$200,000 to \$400,000, according to Citrus officials.

It would also allow the county to get

what it wants half of the cost of the

project," Lyons said. "Tourism officials are baffled at the cost of the project.

Artificial reef structures, like these, are being considered by the Florida Department of Environmental Protection for placement in the Gulf of Mexico. The structures are designed to provide a habitat for marine life.

There are also several soft coral pens in the area.

According to Marcia Toledo, Citrus County's environmental supervisor, the county has applied for a permit to place the reef balls in the gulf to create a habitat for sea life.

But Toledo said the area already is a habitat for natural sea life, including some grunts and algae that would be affected, and the department didn't originally permit replacing one habitat with another.
